Concept

Using the Clarifai machine learning API, I plan to build a simple interface that will allow a user to engage in a meaningful, but conceptual dialogue with a bot. The Clarifai API allows access to several machine learning models that can recognize concepts in a given image. Using this API, I would like to build an interface that presents itself as an AI bot that can facilitate/augment the creative conceptualization process for creatives. This is a further development of the concept I developed for my midterm whereby an AI enhanced visual ideation tool was proposed. Here, the difference is that the output is not visual and the bot is framed as a conversation partner (text-based) for talking about creative 'concepts' (which would be determined by the Clarifai API).
